A cheaper, weirder e-reader alternative to the Boox Palma

There are some notable compromises, like a reflective screen that will potentially have users struggling to dodge glare, ordering off of AliExpress, and a dated Android 11 OS that isn’t fully translated from Chinese to English.

The display is also a few years behind the 300ppi e-paper panels you now get on Kindles, Kobos, and even the Boox Palma, featuring a 5.84-inch E Ink screen with just 276ppi of resolution. The InkPalm Plus also has just 2GB of RAM, 64GB of storage, and a 2250mAh battery, compared to the Palma’s 6GB of RAM, 128GB of storage, and 3,950mAh battery.

The Boox Palma’s storage can be further expanded using a microSD card, and it boasts a microphone and 16MP camera, but as Moltz points out, you’re probably not going to use these for capturing or even watching videos.
