

Aether OS is a computer in a browser built for the AT Protocol

Aether OS puts a full-fledged desktop in your browser that ties directly into the AT Protocol. That means it connects to your Bluesky account and other public records. It offers a pretty full suite of apps, 42 in total, covering text editing, task management, and social media. There's even a rudimentary tracker for making chiptunes, a DAW, and a video editor.

Of course, part of the appeal is also the cyberpunk good looks that draw obvious inspiration from *The Matrix*.

Right now, the project is in alpha, and there are a lot of rough edges. Documentation is also basically non-existent. So, if you get stuck trying to use an app, you're kind of SOL. Oh, and nothing is encrypted or permissioned, so be careful what you store – it's all publicly visible.
