AMD is investigating claims of stolen company data

AMD is looking into a potential cyberattack. A threat actor that goes by the alias “IntelBroker” is selling data that it claims was obtained from an AMD.com breach this month, *BleepingComputer* reports, and the company confirmed in a statement that it’s looking into the purported theft. IntelBroker claims that the data for sale includes future products, employee databases, and customer databases.

“We are aware of a cybercriminal organization claiming to be in possession of stolen AMD data,” AMD said in the statement given to *BleepingComputer*, *PCMag*, and *Bloomberg*. “We are working closely with law enforcement officials and a third-party hosting partner to investigate the claim and the significance of the data.”

In 2022, AMD confirmed it was investigating claims that the hacking group RansomHouse stole 450GB of data.
