

Android's Find My Device app can now show you where people are, too

Google is rolling out a Find My Device app feature update that shows a map of your friends and the family members who share their location with you, *9to5Google* reports. The new feature was announced in the Android March feature update last week and is now available for more users.

There's already a way for friends and family to see each other's shared locations in Google Maps. Now, the Android Find My Device app does double duty, making it easier to find both things and people in one place. The map also shows the locations of friends who share from Google Maps on iOS.

In the app on Android, you can tap the new People tab to show the locations of any contacts that are sharing their location with you. You can also switch to a tab that shows who you're sharing your location with and gives you options such as changing the duration you share your location with someone.

Google's interface is now more reminiscent of Apple's Find My app, which features a similar split-screen UI with a map on top and devices or people on the bottom, depending whether you're viewing items or people.
