Apple Intelligence is now available in public betas

Apple has just released public betas of iOS 18.1, iPadOS 18.1, and macOS Sequoia 15.1, and they include upcoming Apple Intelligence features like text re-writing tools, the glowy new Siri design, a “Clean Up” tool to remove objects from your photos, and more.

To be able to access the betas, you’ll need to register on Apple’s beta software program site. Once you’ve done that, you should be able to see the beta update available in settings for you to download and install. Note that a only few iPhones can access the Apple Intelligence features: last year’s iPhone 15 Pro phones as well as the nearly-here iPhone 16 and iPhone 16 Pro. iPads and Macs with M1 chips or newer can try Apple Intelligence as well.

Previously, these Apple Intelligence features were only available as part of developer betas, and colleague Allison Johnson wrote about her experience testing the tools on iOS in July. But you should know that what’s included in these betas isn’t everything Apple has announced for Apple Intelligence;

there’s more coming down the line.

Apple plans to release the final versions of iOS 18.1, iPadOS 18.1, and macOS Sequoia 15.1 in October.
