Apple releases Chrome extension for iCloud passwords

Apple has released an official extension for the Windows and Mac versions of Chrome that lets you use passwords stored in your iCloud Keychain. For anyone who uses Chrome as their browser and iCloud Keychain in lieu of a dedicated password manager, this could make bouncing between Windows and Mac computers much easier.

The release of the extension means that if you've used Safari to automatically generate strong passwords on other platforms, those can now be available to you in Chrome when you're prompted for a login. Passwords created in Chrome for Windows will also sync back to iCloud so they'll be available on Apple devices as well.

The extension is called iCloud Passwords and is available now in the Chrome Web Store. Details of the functionality were prematurely revealed last week in an update for the iCloud Windows 10 app, which listed "Support for iCloud Passwords Chrome Extension" as a new feature, despite the extension not having been released or otherwise announced.
