# Apple will reportedly allow other AI chatbots to plug into Siri

Apple’s iOS 27 update will allow users to choose the AI chatbot they want to link with Siri. That’s according to a report from *Bloomberg*’s Mark Gurman, who says third-party chatbots downloaded from the App Store, like Google’s Gemini or Anthropic’s Claude, will be able to fetch replies for Siri — similar to how the voice assistant already works with OpenAI’s ChatGPT.

The new system, reportedly called “Extensions,” will give users the ability to enable or disable the chatbots they want to connect with Siri on the iPhone, iPad, and Mac, *Bloomberg* reports. The upcoming integrations will also work with the standalone app Apple reportedly plans on launching for its AI-upgraded version of Siri, which is supposed to take action on your behalf across apps.
