

Google's NotebookLM can sum up your research in a TikTok-style clip

Google's NotebookLM is adding a new way to catch up on your notes: TikTok-style AI videos. The new feature is rolling out to Google AI Ultra and Pro subscribers, allowing NotebookLM to generate 60-second vertical AI clips based on the sources you upload to the app.

The example shared by Google details Australia's unsuccessful war on emus, pairing paper cutout-style AI art of emus with narration. It adds to some of the other ways NotebookLM lets you interact with your research, including by generating AI podcasts, cinematic videos, and visual explainers.

To generate a 60-second clip, head to NotebookLM on the web or app, select a notebook, and then choose "Video" from the Studio column on the right side of the screen. From there, select "Short," choose the topic you'd like NotebookLM to focus on (or enter your own), and then hit the "Generate" button.

The feature is rolling out in English only for now, with support for free users coming "soon."
