

# Intel finally notches a GPU win, confirms Arc B580 is selling out after stellar reviews

Intel is having an incredibly rough year – but at long last, the company's discrete graphics card initiative has produced a card worth celebrating. While we haven't managed to review it ourselves due to a fluke issue, the \$250 Arc B580 "Battlemage" GPU launched to nigh-universal praise, has already sold out most everywhere, and Intel tells *The Verge* it's working to ship new units every week.

"Demand for Arc B580 graphics cards is high and many retailers have sold through their initial inventory. We expect weekly inventory replenishments of the Intel Arc B580 Limited Edition graphics card and are working with partners to ensure a steady availability of choices in the market," Intel spokesperson Mark Anthony Ramirez tells *The Verge*.

To give you an idea, here are some of the headlines we've seen on reviews of this card:

While reviewers have showed the B580 *doesn't* beat the 4060 and 7600 in every game, especially for gamers who still play at 1080p resolution, it does seem to pull ahead on average, the drivers seem more mature than Intel's earlier attempts, and the lower price and generous 12GB of video RAM make it relatively easy to recommend.

If you can find one at \$250, that is – which you probably can't, because they've sold out so quickly. For what it's

worth, Hardware Unboxed's Steve Walton doesn't think this is a so-called "paper launch" where a manufacturer ships a token number of components for bragging rights instead of mass-producing a product; he said that manufacturers, retailers and distributors told him that supply of the card was "quite substantial."
