

Microsoft releases a Copilot app for Mac

Microsoft is releasing a native Copilot app for macOS today. Much like the Windows app, the Copilot version for Mac will provide access to the web-based version of Microsoft's AI assistant, where you can upload images and generate images or text.

The macOS version of Copilot also includes a dark mode and a shortcut command to activate the AI assistant by using Command + Space – much like the Alt + Space on the Windows version. Microsoft is launching this new Copilot Mac app in the US, UK, and Canada today, and the iPad version is also being updated with a split screen mode.

You'll also now be able to log into Copilot on an iPhone or iPad with an Apple ID, and upload text or PDF files to ask questions about the documents or generate a summary about them. This document summarization feature is also coming to the macOS app soon.

The launch of Copilot on macOS comes just days after Microsoft made Copilot Voice and Think Deeper free with unlimited use. Previously, both Think Deeper (powered by OpenAI's o1 model) and Voice in Copilot had limits for free users, but Microsoft has now removed these to allow Copilot users to have extended conversations with the company's AI assistant.
