Microsoft Teams is getting a new Dynamic View feature in March

Microsoft is updating its Teams service with a new Dynamic View in March. This new view allows Teams users to share content side by side with participants. It looks ideally positioned for meetings where someone is presenting a slide deck or if participants are watching a live event together.

Dynamic content like earnings reports, slide decks, or videos can be displayed alongside other speakers. Currently in Teams, video feeds of other participants are tiny when people are screen sharing or presenting decks. Microsoft's Gallery View for Teams will optimize itself automatically with this new view and allow participants to personalize the view.

It will also more clearly highlight active speakers, people who have virtually raised their hands, and allow participants to pin people next to dynamic content. Originally unveiled all the way back in July, this new Dynamic View will be available to all Microsoft Teams users in March, according to Microsoft's 365 product roadmap.

Microsoft Teams usage has soared over the past 10 months of the pandemic, with the service now being used by more than 115 million people daily. Microsoft has been adding features to Teams on what feels like a monthly basis, with virtual breakout rooms appearing in December alongside an improved calling experience.
