

More of the DJI Flip folding drone appears in new leaked images

New images of the rumored DJI Flip folding drone hit late last week, showing the compact, light-colored drone both folded and unfolded, and even in a carrying case. The images appeared in posts by Igor Bogdanov, who has shared other credible DJI leaks in the past.

Bogdanov added in a post yesterday that DJI is preparing a new Cellular Dongle 2 module for the compact drone. The new leaks join earlier images of ND filters for the Flip, its propeller set, and charging hub, which Bogdanov wrote can charge two batteries in a minimum of 45 minutes, and can use “a 65W parallel charger.”

Below are some of the other pictures Bogdanov posted, including of its front screen, which drone leaker Jasper Ellens notes shows “all the handsfree Quickshots we know from the Neo.”

Ellens posted a short video of the drone yesterday, writing that the Flip's registration numbers put it in DJI's FPV drone category, meaning that it could allow for first-person streaming during flight. In early December, he also leaked details like the drone's compact folding approach and that it should get about 30 minutes of flight thanks to a battery that's bigger than the one in DJI's Neo selfie drone.
