

New Apple TV and HomePod mini reportedly coming in 2025

Apple's rumored combo Bluetooth and Wi-Fi chip might be introduced with some of the company's home products in 2025, including a new HomePod Mini and Apple TV, reports Mark Gurman for *Bloomberg*.

Apple's new chip, codenamed "Proxima," is meant to be a major transitional change for the company's devices that reduces reliance on Broadcom, which makes Bluetooth and Wi-Fi components for various devices in Apple's lineup. Sources speaking to Gurman say the chips have been in development for several years and will be produced by TSMC – the same manufacturer that makes Apple Silicon chips.

Gurman didn't specify when the new HomePod Mini and Apple TV might debut next year. The Proxima chip could also appear in iPhones later in 2025 and in the iPad and Mac in 2026, Gurman says.

Apple is also working on a standalone security camera, Gurman says. Gurman has previously reported that the company is gearing up to introduce a wall-mounted smart display for controlling your smart home next year as part of a bigger push into the home.
