Samsung may fix the Chromebook Pro’s biggest problem with a backlit keyboard

For the most part, the Chromebook Pro has what you’d expect from premium Chromebook hardware. Samsung’s machine has a fantastic screen, high-end design, and it runs fast. But there’s one seemingly obvious feature missing from device: a backlit keyboard. It’s a strange omission, especially considering the Pro’s relatively high asking price, but it’s one that may be remedied in future iterations of the hardware. *Chrome Unboxed* has discovered details that point at the addition, though it’s unclear what form it might take. It may be added as part of a second run of the current hardware, or a feature included in a rumored beefed-up version of the Chromebook Pro. While it’s not official yet, the change would make the Pro a much more enticing option in the increasingly crowded Chromebook landscape.
