

The Mac Pro and Studio won't get the M4 nod until mid-2025

Throughout 2024, though, all of Apple's laptops (except the MacBook Air) will move to the M4 chip that the company just gave the iPad Pro, Gurman writes. Amusingly, this herky-jerky chip upgrade cycle means that the iPad Pro is currently the single-core performance champ of Apple's lineup – and it will continue to be for about another year, when compared to the Mac Studio and Mac Pro.

This is a silly comparison, of course – The current crop of Mac Studios and Mac Pros are incredible computers that hold more RAM, have more ports, and won't throttle as quickly as the iPad Pro, even with that heat-conducting Apple logo. They also don't have an operating system that stands squarely in the way of pushing their hardware. And high-end Mac users should be used to waiting a while between revisions. Still, I'm sure more than a few people will appreciate the upgrade when it comes.
