The Prepared Wildlife Photographer with Moose Peterson

Wildlife doesn’t wait. When something incredible happens in front of your camera, you might only have a few seconds to capture it.

That’s the idea behind **Moose Peterson’s** new course. Instead of figuring out exposure, focal length, or your gear when the action starts, Moose shows you how to make those decisions ahead of time.

You’ll learn how he prepares his cameras before heading into the field, from firmware checks and sensor cleaning to working with long lenses and getting exposure dialed in. Moose also covers using flash for color, choosing between teleconverters and crop mode, and even shares his teddy bear exercise for practicing exposure before the real wildlife shows up.

The goal is to make the technical side of photography second nature, so when the moment happens, you’re free to concentrate on the subject and the story.

Watch Moose tell you more about it below, and then check it out today (you can watch the first lesson for FREE)!
