Tim Cook says more AIs are coming to Apple Intelligence

This isn’t the first time we’re hearing about third-party integrations, as Apple software SVP Craig Federighi said last year that the company “may look forward to doing integrations with different models like Google Gemini in the future.”

Cook also said that Apple is on track to release an AI-upgraded Siri next year, adding that “our intention is to integrate with more people over time.” Apple is “making good progress” on Siri, he added during an earnings call on Thursday, noting that AI acquisitions are still on the table. “We are open to pursuing M&A [mergers and acquisitions] if we think that it will advance our roadmap,” Cook said, echoing a statement from July.

The news comes as Apple releases its fourth quarter earnings results, which revealed that the company raked in a record $102.5 billion over the past few months, marking an eight percent increase when compared to the same time last year.

Sales from the iPhone 17 lineup likely only make up a small portion of Apple’s overall $49.03 billion in iPhone revenue. The new lineup includes the iPhone Air — Apple’s thinnest device yet — along with the upgraded iPhone 17 and 17 Pro. This year, Apple brought some features previously reserved for its Pro-level iPhones to its entry-level device, including an always-on display with ProMotion support for smoother scrolling.

Apple’s Mac revenue rose to $8.72 billion, and it reported $6.95 billion in revenue from iPads. Apple’s services division, which includes subscriptions to Apple TV, Apple

Music, Apple Fitness Plus, and Apple Arcade, grew to $28.8 billion.

Update, October 30th: *Added context from Cook.*
