Vergecast: Windows 11 leaks, RCS encryption, and this week in antitrust policy

Every Friday, *The Verge* publishes our flagship podcast, *The Vergecast*, where co-hosts Nilay Patel and Dieter Bohn discuss the week in tech news with the reporters and editors covering the biggest stories.

In this episode, the show is split into three sections. First, Nilay and Dieter talk to *Verge* senior editor Tom Warren about this week in Microsoft: leaks of the Windows 11 UI, announcements from E3 2021, and Microsoft CEO Satya Nadella doubling as the company's chairman.

In section two of the show, *Verge* politics reporter Makena Kelly returns to explain the continuing push by the US government to enact antitrust legislation on tech monopolies — this week, five new bills were introduced and the Senate confirmed a new commissioner of the FTC.

In part 3, *Verge* managing editor Alex Cranz joins in to chat about this week in gadgets and Google — the company is adding end-to-end encryption to their Messages app, Sonos officially announced their picture frame speaker, and Telsa's Model S Plaid made its big debut.

You can listen to the full discussion here or in your preferred podcast player.
