

WD's 2TB SSD for Xbox is \$50 off and the M4 MacBook Air is just \$899

Maybe, like me, you bought the Xbox Series S with 512GB of storage and realized, after installing *Call of Duty: Black Ops 6*, that you don't have much (or any) space left for any other games. And maybe, like me, you had to hunt for another drive so you could install other games to play.

If you're still in that boat, you might want to consider Western Digital's 2TB WD_Black NVMe solid state drive. It's currently on sale at Amazon for an all-time low of \$179.99 (\$50 off), or about 22 percent off the standard price, and will provide you with plenty of additional storage to work with. To put the price in perspective, it's only \$30 more than the 1TB version, which isn't on sale. WD is also one of two manufacturers I'm aware of that make these easy plug-in cards – the other is Seagate.

There's no fiddling around with screws or anything to get it to work, either. Just pop it into the back of your Xbox Series S / X, and bam, you're good to go. Plug and play at its finest, baby.

But let's pivot to another good deal real quick.

Amazon and B&H Photo are also selling Apple's brand-new M4 MacBook Air, which just launched in March, starting at \$899 (its best price to date). That's \$100 off Apple's starting price of \$999, which itself is already \$100 cheaper than the entry-level price of the M3 model last year.

And, with the M4, you get 256GB of starting storage instead of 128GB, which is probably fine for most folks who don't need a lot of local storage. Like me, for example. I'm using an M2 MacBook Air for work, and I only have 82GB used.

The latest M4 model also has a better 12-megapixel Center Stage camera that will follow your face around while you're on camera (better said: it'll keep you in frame) and 16GB of RAM. The design is unchanged from last year, which means you're still getting just a MagSafe charger and two USB-C ports. But the update to M4 allows you to add two external monitors while also leaving the display open, for a total of three running screens. Good for multitasking.

It's a MacBook Air. It's the best MacBook for most people. You really can't go wrong here.
