Windows 11’s Vision Pro-like remote desktop is now widely available on Quest 3

After downloading Mixed Reality Link on a Windows computer, Quest 3 and 3S wearers can look at their keyboard and select “pair” to view and interact with their desktop display from their headset. Meta notes that you can either immerse yourself in your virtual desktop or use passthrough so that you can still see your surroundings.

Aside from this update, Meta is also rolling out the ability to rescale and resize displays across all apps, as well as a Full Passthrough feature to quickly check the environment around you by double-tapping on the side of your headset or clicking the action button on the Meta Quest 3S. You can now open up to 12 apps at once, too.
